

ABSTRACT

5 The Drawer sommier is a cabinetwork frame for
supporting mattresses using wood without iron to obtain
the wooden spring rigidity and using wooden crossbars (3)
with sufficient height to hold the weight of the persons.
This allows the framework (1) to be enclosed with wood
at the bottom, providing an air chamber (5) between the
enclosed bottom (4) and the mattress. The special form of
10 the corner pieces (6) allows the corners of the bed to be
rounded.
